THE

PLATFORM MISSION

Continuously accelerating our ability to deliver value to our customers with technology.

We do this by building and maintaining a trusted self-service platform that empowers Lunar developers to move fast, easy, efficiently, compliant, and secure focusing on high quality, self-service access to enabling technology.

HOW

WE BUILD

Self-service platform

Reconciliation and agents

Cloud agnostic and open source

Managed solutions
where it makes sense

Microsoft
Azure

Managed solutions
where it makes sense

Google Cloud Platform

Managed solutions
where it makes sense

Treat developers as customers by applying a product mindset to the engineering platform and tooling.

ELEPHANT IN THE ROOM

MULTI-CLOUD, WHY?

Danish neobank Lunar acquires Swedish lender Lendify

Written by [Ruby Hinchliffe](#) 22nd April 2021

Lunar, the Nordic neobank with offices across Denmark, Sweden and Norway, has acquired Swedish lending and savings platform.

The deal, the sum of which remains undisclosed, is perceived as a significant move for Lunar.

The Danish challenger intends to grow its consumer credit offering through Lendify, having launched its own credit buy now, pay later product back in December.

Lendify's loan book is worth some €300 million, bringing it a total of 40,000 active savings and loan customers.

Lunar, which has acquired 250,000 customers of its own, will also use Lendify's customer base to sure up its position in the Swedish market as part of a wider pan-Nordic expansion play.

"Lendify has for several years been considered one of the leading fintech companies in the Nordic region."

Lunar set to acquire Norwegian digital bank Instabank for €132m

Written by [Alex Pugh](#) 29th March 2022

Danish neobank Lunar looks set to continue its Nordic expansion with the acquisition of Norwegian digital bank Instabank.

Lunar has offered €132 million in cash to buy Instabank, representing NOK 3.75 (€0.39) per share.

Instabank's board has voted unanimously to approve the deal, as have shareholders representing 73% of the remaining share capital.

Lunar says the deal will "significantly increase" its footprint in Norway and "additionally open the door to the Finnish market ahead of launching its full product offering".

Instabank's chair of the board of directors, Cathrin Nylander, says the combination of Instabank and Lunar will create "a strong Nordic fintech attractively positioned to compete with the Nordic banking leaders".

Founded in 2016, Instabank claims more than 60,000 customers in Norway, Finland and Germany, providing both secured and unsecured loans and savings.

Lunar has offered €132m in cash to buy Instabank

Like for an undisclosed sum.

Paylike was founded in 2015 and operates across Europe

g its banking licence in August 2019.

MULTI-CLOUD GIVES ACCESS TO FIT FOR PURPOSE TECHNOLOGY

Utilize the best offerings of each cloud provider.

Avoid vendor lock-in for leaner exit strategies.

MULTI-CLOUD SUPPORT THE LUNAR GROWTH STRATEGY

Ensure a cloud agnostic platform to support acquisitions and mergers.

HOW TO

CONNECT CLUSTERS ACROSS PROVIDERS?

HOW TO

CONNECT CLUSTERS ACROSS PROVIDERS?

VPC Peering

VPN

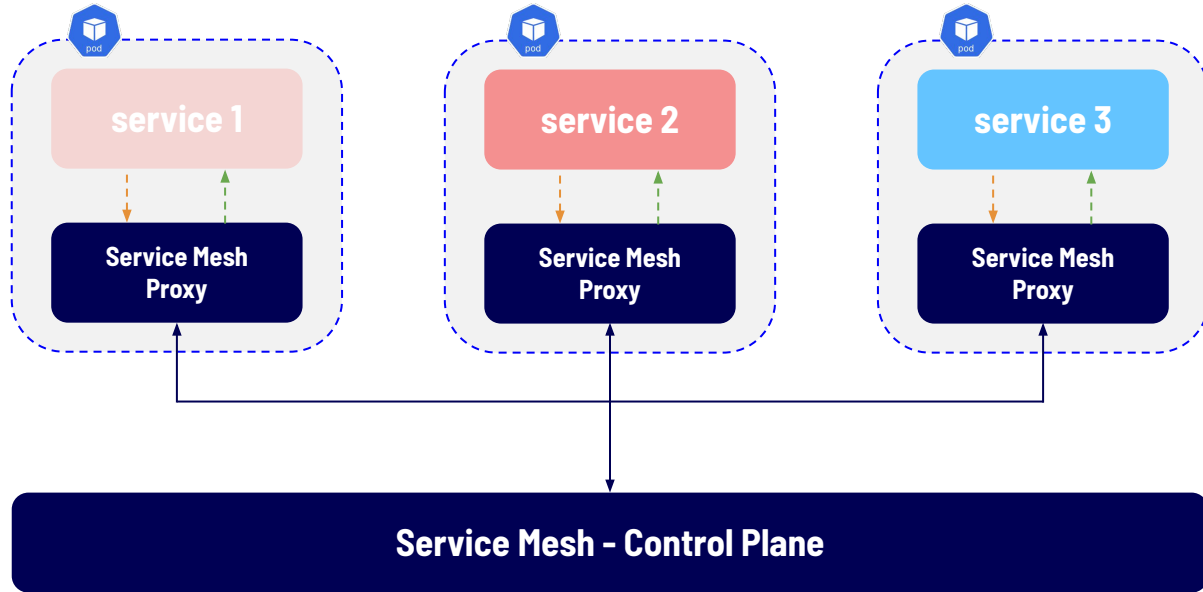

mTLS

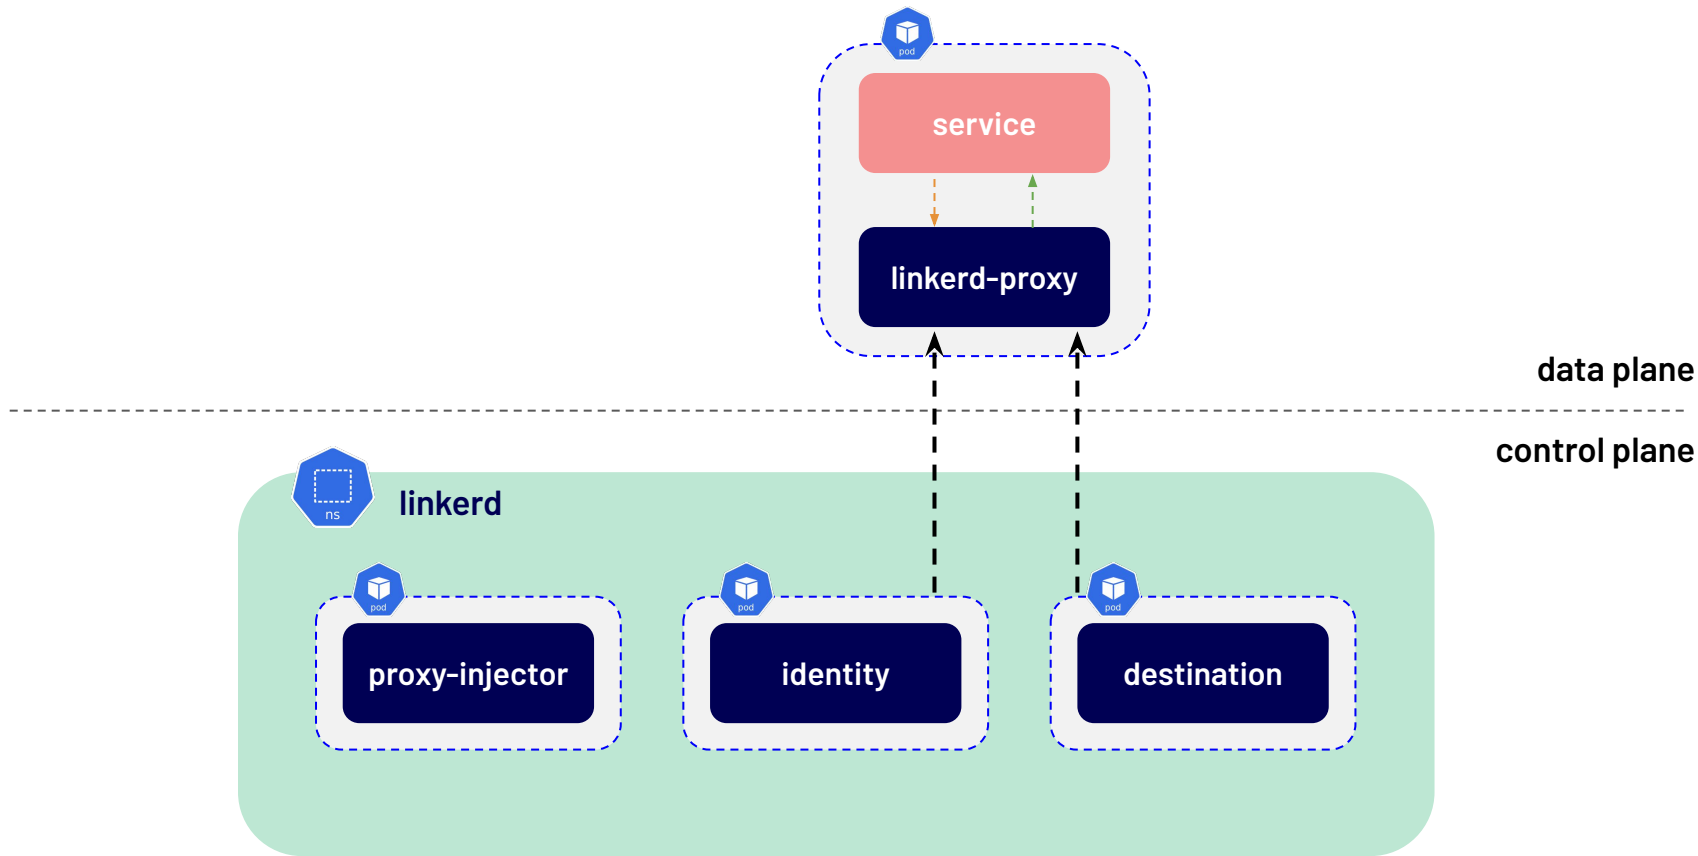

**We have been
“evaluating”
Service Mesh
since 2017.**

tl;dr:

Service meshes like Linkerd and Istio are tools for adding observability, security, and reliability features to applications by inserting them at the platform layer rather than the application layer.

All communication is transparently mutually encrypted (mTLS)

NEXT LEVEL

EXTENDING THE MESH TO MULTIPLE CLUSTERS

CORE

MULTI-CLUSTER COMPONENTS

The ***service mirror*** component watches a target cluster for updates to services and mirrors those service updates locally on a source cluster. This provides visibility into the service names of the target cluster so that applications can address them directly.

The ***multi-cluster gateway*** component provides target clusters a way to receive requests from source clusters.

DIY

LINKING TWO CLUSTERS

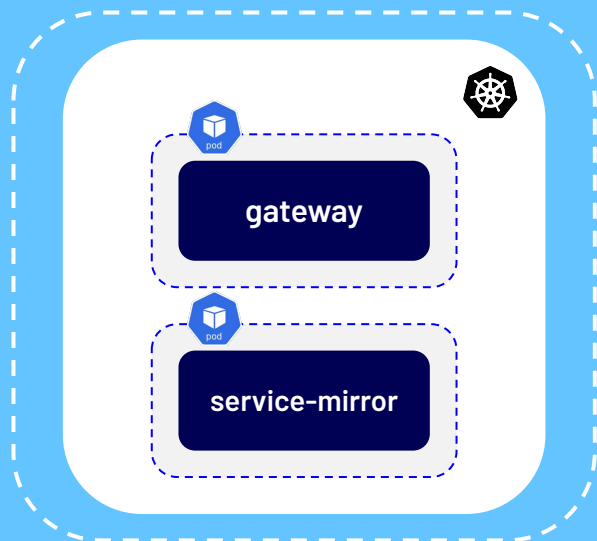

```
// Install linkerd-multicluster in both clusters
$ linkerd multicluster install | kubectl apply -f -

//Generate a link that allows services in east to be mirrored to west
$ linkerd --context=east multicluster link --cluster-name east |
  kubectl --context=west apply -f -

//Generate a link that allows services in west to be mirrored to east
$ linkerd --context=west multicluster link --cluster-name west |
  kubectl --context=east apply -f -
```

CENTRALIZED LOG MANAGEMENT

A man in a blue suit is sitting on a blue sofa, holding a laptop. Next to him is a table with a chessboard. The scene is set in a room with blue walls and a blue carpet. The man is looking towards the camera with a thoughtful expression.

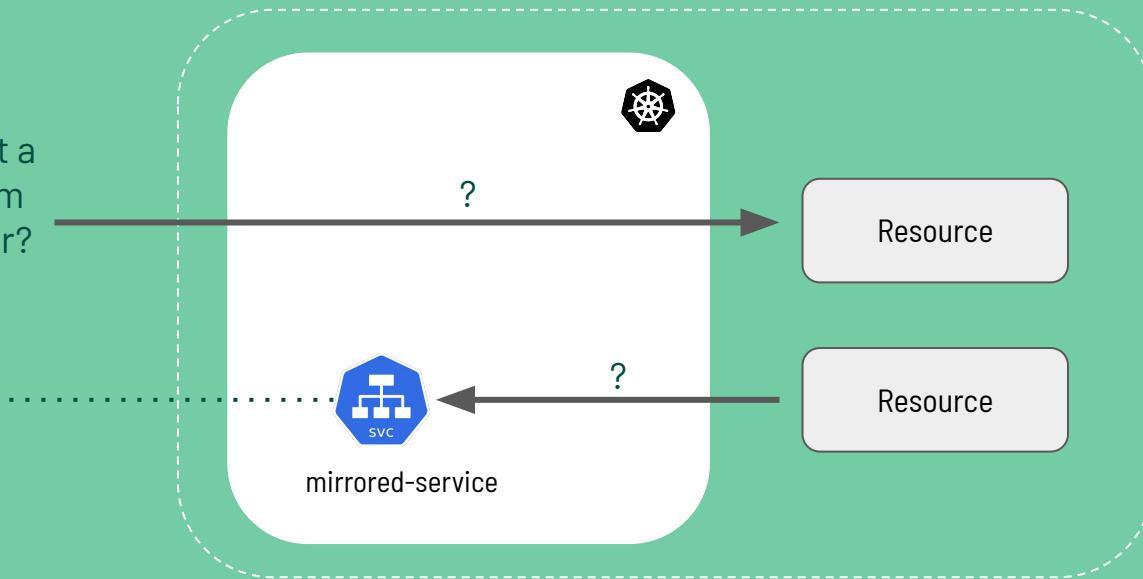

PROBLEM

**WHAT ABOUT SERVICES
RUNNING OUTSIDE THE
CLUSTER?**

EDGE

INGRESS/EGRESS

How to request a resources from another cluster?

How to request a mirrored service?

HOW

INTRODUCING THE BACKBONE GATEWAY

The responsibility of the backbone-gateway proxy is to provide a simple abstraction that allows exposing services running in cloud providers for services in a cluster or outside a cluster on a different provider.

EDGE

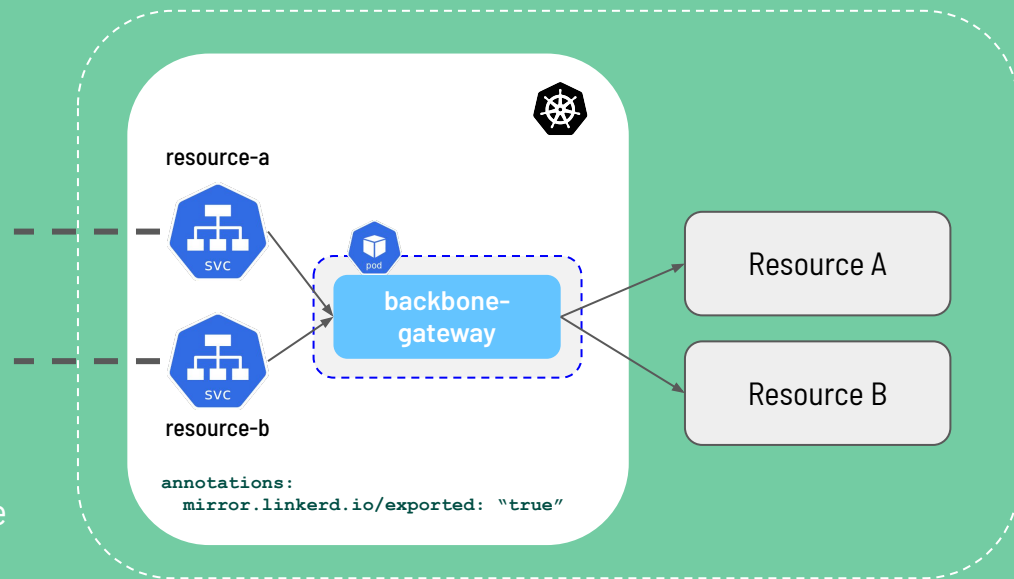

EGRESS

shuttle.yaml

```
targets:  
  - hostName: resource-a  
    dnsName: resource-a.azurewebsites.net  
    environment: east  
    squad: maxus  
  
  - hostName: resource-b  
    dnsName: resource-b.azurewebsites.net  
    environment: east  
    squad: maxus
```

Services will be mirrored to the opposite cluster and be available as e.g.

<http://resource-a-east.namespace.svc.cluster.local>

EDGE

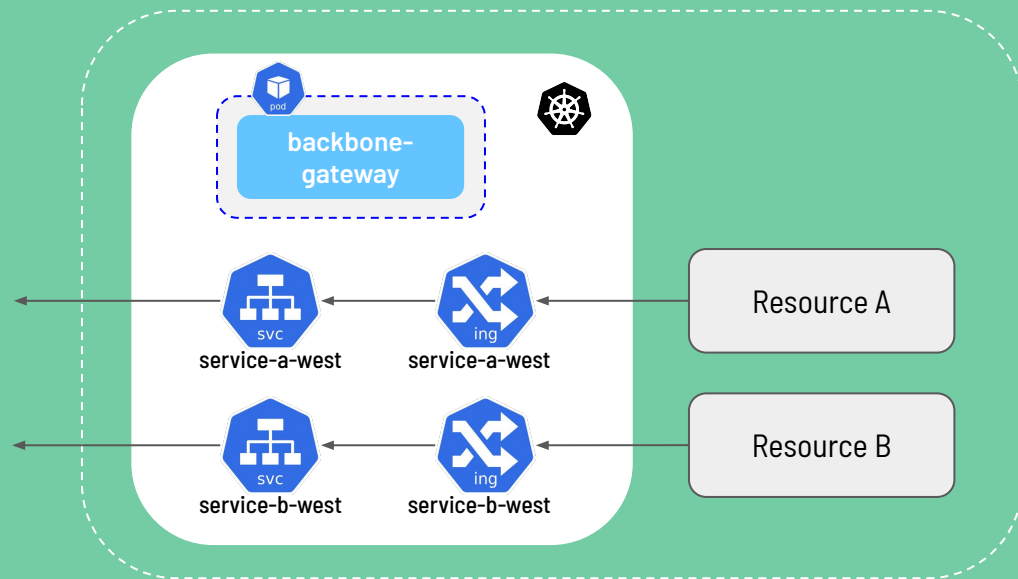

INGRESS

shuttle.yaml

```
ingress:  
  - service: service-a  
    namespace: services  
    cluster: west  
    squad: nasa  
    port: 3000  
  
  - service: service-b  
    namespace: services  
    cluster: platform  
    squad: nasa  
    port: 3000
```

The backbone-gateway is responsible for creating ingress objects.

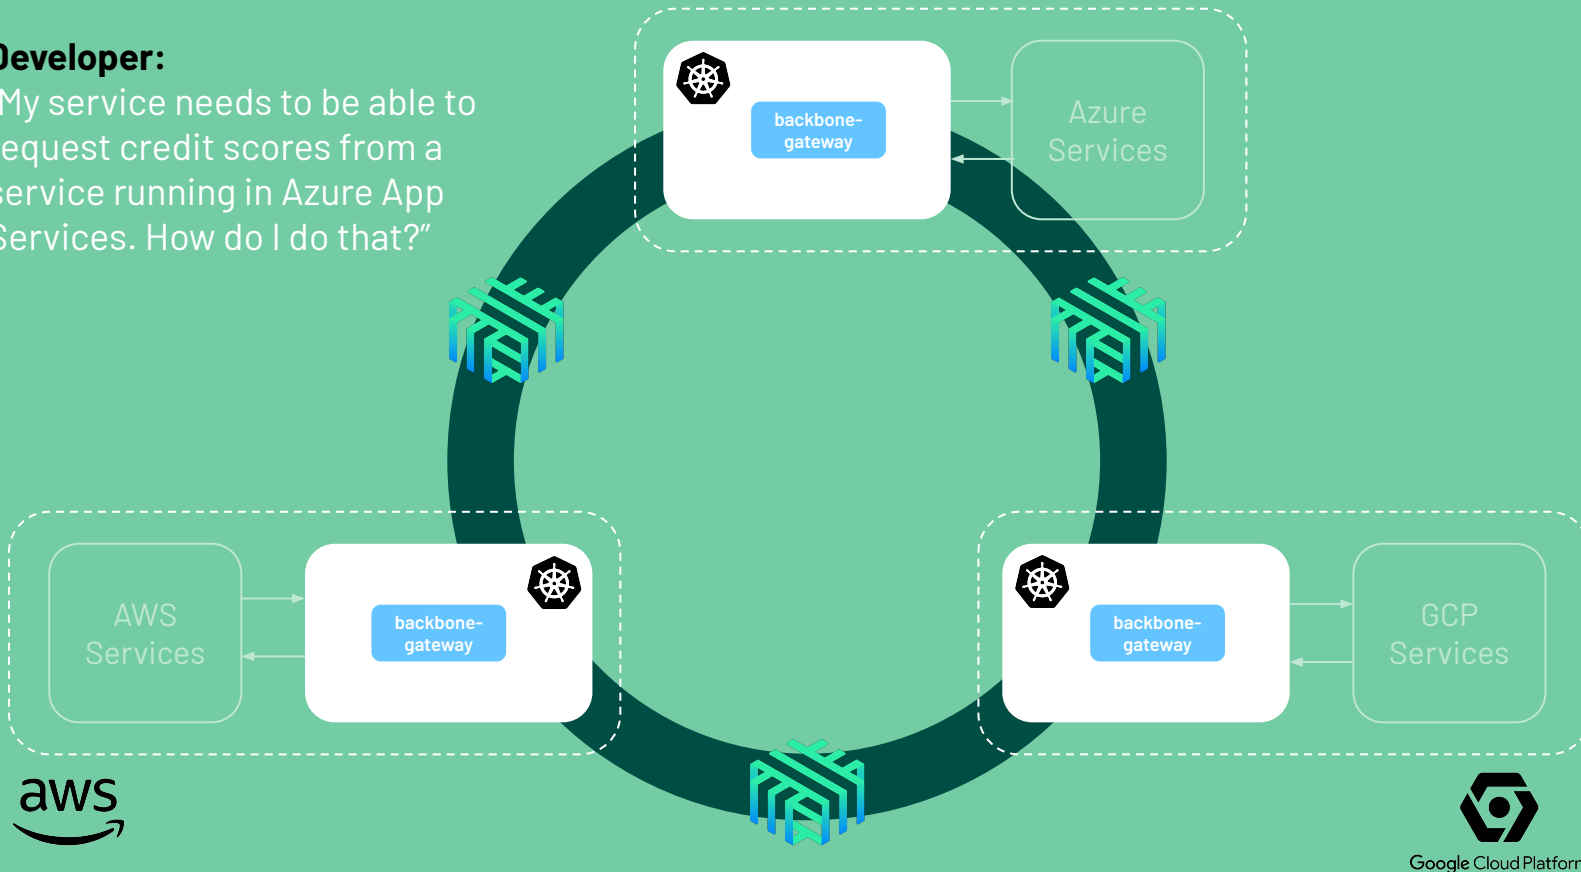

nginx-ingress-controller, external-dns, and cert-manager ensures networking

Developer:

“My service needs to be able to request credit scores from a service running in Azure App Services. How do I do that?”

Developer:

A photograph of two men in suits standing on a rooftop. The man on the left is wearing a light blue striped shirt, a bright green tie, and a green patterned vest and trousers. The man on the right is wearing a pink suit jacket and trousers, holding a black briefcase. They are leaning against a metal railing. The background is a clear blue sky and a dark grey concrete structure.

LAST PIECE OF THE PUZZLE

MANAGING CLUSTERS ACROSS CLOUDS

PRINCIPLES OF

GITOPS

all changes are **audited** and no access to production systems is needed (ideally)

desired state
expressed
declaratively

stored in a way that supports
versioning, immutability of
versions, and retains a complete
version history

software agents continuously,
and automatically, compare a
systems **actual state** to its
desired state

“Compare the **running state of our system with the **desired state** - **continually** - and whenever these get out of sync, force the running state to **converge** to the desired state.”**

- Alexis Richardson, CEO at Weaveworks

MANAGING CLUSTERS WITH A

CONFIG REPOSITORY

Desired state

Software Agents

Actual State

GITOPS AS A TOOL FOR

MULTI-CLOUD MANAGEMENT

- ★ GitOps gives us an audit trail across changes to all cloud providers
- ★ GitOps allow us to enforce least privileged access
- ★ GitOps allow us to treat clusters as cattle (to some extent)
- ★ GitOps ensures that process for release is the same across cloud providers

HOW

WRAPPING UP

WHAT'S THE END GOAL?

Should developers be able to just use the cloud they see fit?

- No, there's a lot of considerations, like latency etc.

What about asynchronous messaging across clouds?

- We currently are looking into how we can provide a way to utilize our event driven model beyond a single cloud.

Will you at some point consolidate and move everything into one provider?

- Maybe, at least, now we have a strategy.

THAT'S ALL FOLKS

QUESTIONS?
